REPLY EXPERT REPORT OF PROFESSOR DOUGLAS C. SCHMIDT, Ph.D.

February 29, 2016

HIGHLY CONFIDENTIAL

Table of Contents

I.   ASSIGNMENT

1.   I have been asked to review and comment on several specific issues discussed in the Rebuttal Expert Report of Dr. Owen Astrachan ("Astrachan Rebuttal Report") and the Expert Report of Dr. Gregory K. Leonard ("Leonard Report").

2.   In particular, I have been asked to provide additional discussion of the authorship of Android source code, attributes of the Java platform, and Android's incompatibility with the Java platform. These issues were discussed at various points in the Astrachan Rebuttal Report and the Leonard Report, and were either described using incomplete scenarios or subjected to erroneous claims that merit clarification.

3.   I am being compensated for my work on this case at a rate of $550 per hour. My compensation is not contingent upon my testimony or on the result of this proceeding.

4.   As described in my Opening Report filed on Jan 8, 2016 and my Rebuttal Report filed on Feb 8, 2016, my work is ongoing, and I reserve the right to modify or supplement my conclusions as additional information becomes available to me, or as I perform further analysis.[1]

II.   QUALIFICATIONS

5.   My credentials are detailed in §II of my Opening Report, filed on January 8, 2016. (Schmidt Opening Report, ¶5-18). My full qualifications and complete CV are also presented in Appendix A of my Opening Report.

III.   MATERIALS RELIED UPON

6.   In drafting this report, I have relied upon a number of different public sources, official declarations and expert reports from the present matter, original empirical analyses, and my own

---

[1]   I would like to correct the following typographical errors in my Rebuttal Report: 1) Table 6 3rd row, replace "SList" under Java Collections with "(LinkedList)"; 2) ¶171 Sentence 3 and 4 should read: "He identifies printf() as being in both C and Java–and by doing so willfully ignores the ubiquitous System.out.println() method, which is the most recognizable Java variant of the C printf() function.[129]"; 3) Table 10, delete rows 1 and 2 that start with the words "Writes a formatted String to standard output" and "Reads a single character from standard input" respectively; 4) ¶196 Sentence 1 and 2 should read: "As discussed already, there are numerous examples within the context of the Java platform where developers might learn to use different APIs by learning the declaring code and SSO, but which provide the same or similar functionality. See Section §VII-E, above."; 5) ¶133, Replace Figure 34 reference with Figure 35; 6) ¶290, Replace Figure 36 reference with Table 12.

background, experience and knowledge of certain topics and events relevant to the issues at hand in this case.

7.   I have also relied upon my own experience and background as a professor, researcher, software developer, published author, and lifelong student of computer science topics. In particular, I have drawn on my specific knowledge concerning programming in Java and Android environments, as I have taught courses on both platforms to tens of thousands of people during the past decade.

8.   A list of the specific materials that I have relied upon and considered in preparing and drafting this report is available in Appendix A.

IV.   SUMMARY OF OPINIONS

9.   The Astrachan and Leonard Reports fail to properly measure and assess the true balance of Android's original and non-original content. More detailed and accurate counting of code lines illustrates that the amount of Android code directly attributable to Google amounts to be a far less substantial portion of Android than claimed by Drs. Astrachan and Leonard.

10.   In his Report, Dr. Leonard ignores the distinct advantages that the Java platform afforded Google—a fact confirmed by Google itself. While Dr. Leonard attempts to minimize the benefits of the Java platform by listing potential substitutes that Google allegedly could have adopted, he fails to address aspects of those alleged alternatives that would make them less suitable for Google's needs than the Java platform.

11.   The Android platform is incompatible with Java based on the Java Compatibility Kit ("JCK") for Java SE 1.4 and Java SE 5.0. While Dr. Astrachan attempts to dispute the relevance of the more recent JCK signature tests, analysis using the older JCK signature tests also confirms that Android is incompatible with Java SE.

12.   Dr. Leonard overstates the capabilities and efficacy of using native code tools (such as the NDK) and the general prevalence of native code-driven content in the Android ecosystem. A more thorough examination of Dr. Leonard's examples shows that his exemplars of native code-driven creativity are, in fact, non-representative. In addition to being disproportionately sampled

from gaming applications relative to the most popular apps in Google Play, they also contain significant amounts of Java code.

13.   Dr. Leonard and Dr. Astrachan continue to erroneously claim that the copied 37 Java API Packages are part of the Java programming language. Even assuming that parts of the 37 Java API Packages mentioned in the Java Language Specification are part of the Java programming language (which I disagree with), very little of the code or SSO that Google copied in the 37 Java API Packages are mentioned or described in the Java Language Specification.

14.   Dr. Leonard overstates the cross-platform support enabled by tools, such as RenderScript. He fails to mention that RenderScript is being deprecated for use as a graphics engine in Android and is used much less frequently than Java in the Android platform software stack. Moreover, it does not appear that RenderScript is covered in the "Nanodegree" courses that Google co-created with Udacity on Android app programming.

15.   In his Rebuttal Report, Dr. Astrachan mischaracterizes certain elements of the Android compiler and runtime environment. Specifically, his characterizations that the dex compiler is not a compiler and that ART is not a virtual machine because it does not do runtime interpretation of bytecode are not accurate. In this report, I show that the "dx tool" source code specifically references compilation activity. Moreover, ART contains functionality that *does* perform runtime interpretation of bytecode, which resides in the art/runtime/interpreter folder in Android releases K, L, M, and the Master branch.

16.   In his rebuttal Report Dr. Astrachan overstates his claim that "Android fails to build when any one of the method declarations in the 117 Android API packages has been removed." Using build tests and using Dr. Astrachan's methodology of removing the same one method declaration at a time, I confirm that removing the same method declaration in the same class (WifiManager) that Dr. Astrachan claims to cause a build failure, actually successfully builds. This result refutes his claim that Android fails to build if any one of the method declarations in the 117 Android API packages has been removed.

17.   Dr. Astrachan continues to overlook the portability enabled by the Java platform. He furthermore casts problems common to all platforms as unique to the Java platform, while neglecting to mention the tools that Sun and Oracle provide that allow developers to minimize

the portability problems he alleges. Similar to Dr. Leonard, Dr. Astrachan's selective examples are not representative of developer experiences with the Java platform over the past two decades.

V. THE ASTRACHAN AND LEONARD REPORTS FAIL TO PROPERLY MEASURE, ASSESS, AND INTERPRET THE TRUE BALANCE OF ANDROID'S ORIGINAL AND NON-ORIGINAL CONTENT

18.   I understand that Dr. Leonard uses the number of lines in Android—as counted by Dr. Astrachan—to reach opinions relating to damages in this case.[2] However, neither Drs. Astrachan nor Leonard acknowledge that the majority of code in the Android platform is either attributable to third parties, not properly assigned, or consists of blank lines and comments from Google (or Google-owned) authors. In his rebuttal report (and as discussed below), Dr. Astrachan examines the copyright notice of a source code file to reach opinions relating to the authorship of that source code. Following Dr. Astrachan's lead on examining copyright notices, an analysis of the Android codebase confirms that Google's own contributions represent a minority of the non-kernel portions of the Android software stack.

A.   Methodology

19.   To evaluate the relative contributions of Google to the non-kernel portion of the Android stack, I first determined which authors should be considered "Google" authors for purposes of the analysis. I generated a list which includes Google and all of its subsidiaries.[3] This list, available in Appendix B, was designed to be as broad as possible, to give Google the maximum benefit of potential authorship.

20.   Once this list was generated, the second step was to screen all the source folders in the Android stack for reference to Google or any of its 250+ potential subsidiaries listed in Appendix B. Any copyright notice that contained any of these "match" names was considered attributable to Google. Files with copyright notices containing "Android" or "Google" were also attributed to Google/Android. Finally, to remain conservative, files with multiple copyright notices (e.g., with

---

[2]   Leonard Report, ¶200.
[3]   Subsidiary and target names were identified through M&A/Private Placement analysis in CapitalIQ. Additional subsidiaries and targets were identified through a Data Science Central exploration (http://www.datasciencecentral.com/profiles/blogs/a-to-z-list-of-google-acquisitions-and-where-they-ended-up-within) that specifically examined the acquisition and integration of all of Google targets. The two lists were then combined to ensure maximum possibilities for cross-referencing. It is likely that many of the 250+ names are engaged in business unrelated to code creation.

IBM or Sun or Oracle) that also included Google or Android, were also assigned wholly to Google/Android.

21.   The non-kernel portion of the Android software stack includes folders that largely only contain third party (i.e., not Google) code. As a third step, I examined any "match" that occurred in such folders to determine whether the positive match name was, in fact, a copyright attribution, or simply a variable referenced in source code for another purpose. Positive matches that were copyright attributions to Google or any of its subsidiaries were included in the total count of Google/subsidiary attributions.

22.   A fourth step involved examination of files that contained no copyright attribution to see if further authorship could be assigned based on their folder location. Although I ultimately did not assign copyright attributions for these files based on this approach, this exercise helps provide directional guidance on possible authorship.

B.   Results

23.   A summary of the resulting line counts and attributions in Android Donut is listed below in Table 1. This table includes raw numerical and percentage figures for both all-inclusive line counts, as well as source lines of code ("SLOC").[4]

Table 1: Line Count and Attribution for Android API Level 4 ("Donut")

	Files	Lines	SLOC	Lines / total lines	SLOC / total SLOC	Blank Lines & Comments / total lines	SLOC / total lines
Google & Subsidiary Copyright	8,908	2,296,438	1,436,160	23.1%	23.7%	8.7%	14.5%
3rd Party Copyright	19,367	6,331,958	3,820,308	63.8%	63.1%	25.3%	38.5%
Unspecified Copyright	6,415	1,296,870	800,332	13.1%	13.2%	5.0%	8.1%
Total C, C++, Java, Header files	34,690	9,925,266	6,056,800	100.0%	100.0%	39.0%	61.0%

---

[4]   In simplistic terms, source lines of code ("SLOC") refers to "non-blank, non-comment lines." A more formal definition can be found at http://www.dwheeler.com/sloccount/sloccount.html. Scripts used for this analysis are provided in Appendix C. Only lines of code in .h, .c, .cpp and java files are included for this analysis.

24.   Several patterns emerge from this result. First, the majority of Android's codebase is attributable to third parties, and includes the copyrighted Oracle API code in question. Moreover, indeterminate authorship, blank lines, and comments (in Google files) account for more of the Android code base than actual original Google content. Ultimately, Google's code content in Android Donut only accounts for approximately 23% of the total lines of code, and 14% of code in Android Donut consists of Google original source code after excluding blank lines and comments. A visualization of attributable code copyright is provided in Figure 1, below.

<u>Figure 1: Attributable Authorship in Android Donut Code</u>
25.   Finally, even though ~13% of the overall source lines in Android Donut cannot be assigned to a specific copyright holder, additional evidence suggests that it is unlikely that this code is attributable to Google. First, I would expect—and have seen—that Google choses to affix its copyright notice to code for which it is the author. The fact that code does not have any copyright notice indicates to me that it was likely not authored by Google. In addition, the location of these files in the Android source code suggests it is unlikely that this code is attributable to Google. As an example, I found a large number of indeterminate files were in the External folder, which typically contains third party content.[5]

---

[5]   I found that more than 3,500 files out of the 6,415 files with unspecified copyrights were located in the External folder. To confirm my understanding that the External folder typically contained third party content, I compared the number of Google assigned files in this folder to the third party assigned files, and found 9 times more third party files. Finally, if one were to assume that all indeterminate code that is not found in the External folder is, in fact, attributable to Google, that still only results in 17% of code in Android Donut consisting of Google original source code after excluding blank lines and comments.

26.   I conducted this same analysis on the Android Gingerbread code base. A summary of the resulting line counts and attributions in Android Gingerbread is listed below in Table 2.

Table 2: Line Count and Attribution for Android API Level 9 ("Gingerbread")

	Files	Lines	SLOC	Lines / total lines	SLOC / total SLOC	Blanks Lines & Comments / total lines	SLOC / total lines
Google & Subsidiary Copyright	17,542	3,872,045	2,447,294	26.5%	26.5%	9.8%	16.8%
3rd Party Copyright	27,354	8,705,989	5,492,219	59.7%	59.5%	22.0%	37.7%
Unspecified Copyright	8,941	2,008,766	1,298,790	13.8%	14.1%	4.9%	8.9%
Total in C, C++, Java, Header files	53,837	14,586,800	9,238,303	100%	100%	36.7%	63.3%

27.   Examining the results from Android Gingerbread, the same patterns become clear as with the Android Donut results. First, the majority of Android's codebase is attributable to third parties, and includes the copyrighted Oracle API code in question. Moreover, indeterminate authorship, blank lines, and comments account for more of the Android code base than original Google content.   Ultimately, Google's code content in Android Gingerbread only accounts for approximately 27% of the total lines of code, and ~17% of Android Gingerbread consists of Google original source code after excluding blank lines and comments.   A visualization of attributable code copyright is provided in Figure 2 below.

10   Expert Report of Prof. Douglas C. Schmidt

Figure 2: Attributable Authorship in Android Gingerbread Code

Gingerbread
Total Lines of Code
28.   Finally, similar to Android Donut, even though ~14% of the overall source lines in Android Gingerbread cannot be assigned to a specific copyright notice, evidence that most of this code is located in the "External" folders suggests that it is unlikely that this code is attributable to Google. First, as mentioned above, I would expect—and have seen—that Google choses to affix its copyright notice to code for which it is the author. In addition, the location of these files in the Android source code suggests that it is unlikely that these code could belong to Google. As an example, I found a large number of indeterminate files were in the External folder, which typically contains third party content.[6]

C.   Specific Example Called out by Dr. Astrachan

29.   Dr. Astrachan's report points to the "getCollationElementIterator" method in the "RuleBasedCollator" class as an example of unoriginal code for which Sun or Oracle allegedly do not hold the copyright. (Astrachan Rebuttal Report, ¶116). I disagree with his conclusion.[7]

---

[6]   Of the files with indeterminate copyright I found that 5,744 files out of the 8,941 files were located in the External folder. To reaffirm my understanding that the External folder typically contained third party content, I compared the number of Google assigned files in this folder to the third party assigned files, and found 5 times more third party files. Finally even if one were to assume that all unassigned code that is not found in the External folder is, in fact, attributable to Google, that still only results in ~19% of code in Android Gingerbread consisting of Google original source code after excluding blank lines and comments.

[7]   In Appendix G, I provide more examples of the method declarations that describe the same things I said about "getCollationElementIterator" in my Opening Report.

30.   First, it is my understanding from counsel that the Court has determined all code in the copied 37 API packages is properly copyrighted and owned by Oracle. Additionally, Dr. Astrachan fails to discuss or show the Oracle copyright notice clearly included at the top of the "RuleBasedCollator" class file in Java SE 5.0. Figure 3 below shows the full copyright of the "RuleBasedCollator" class file.

Figure 3: Copyright Notice in the RuleBasedCollator Source File in Java SE 5.0
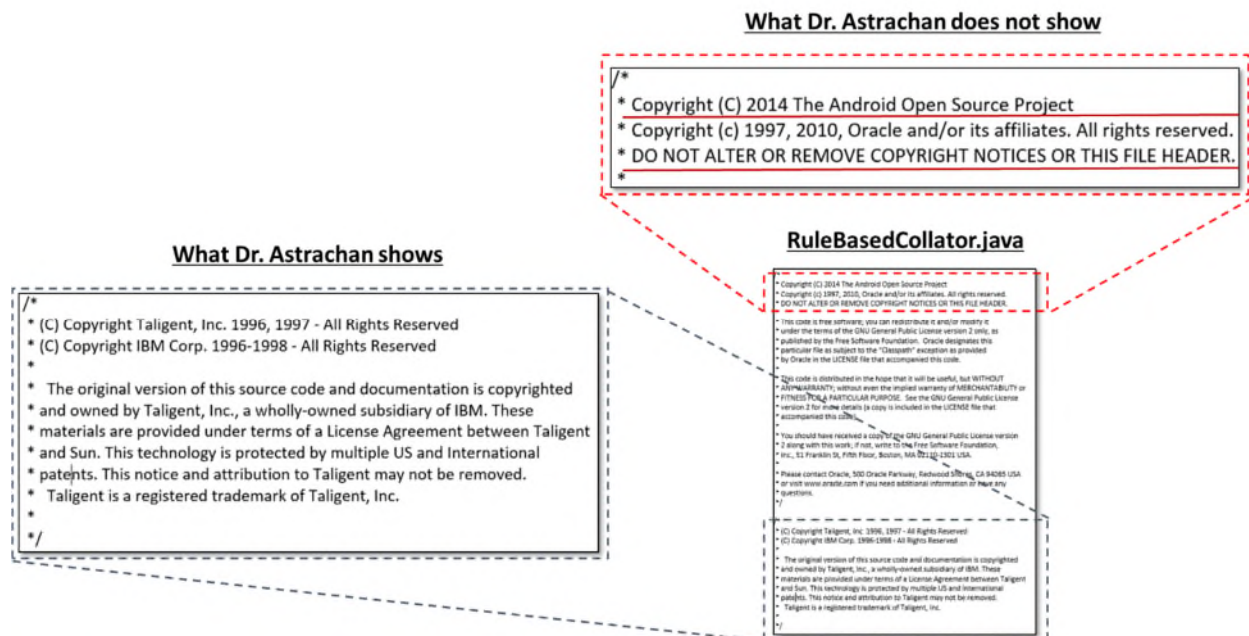

Dr. Astrachan's opinions on this topic, like his discussion of class and method names in his Opening Report and Rebuttal Report, consists of isolated, non-representative examples generalized in a manner designed to project an oversimplified and, in this case, outright misleading rendition of Oracle's ownership of copyrights for the Java platform.

31.   I also compared the "RuleBasedCollator" class file cited by Dr. Astrachan published by IBM as a part of ICU 2.2 (Astrachan Rebuttal Report, ¶119)[8] to the class file of the same name in Java SE 5.0 and found significant differences between the declaring code in Sun's and IBM's files.[9] For example, IBM defines RuleBasedCollator as a final class, which means that it cannot be extended

---

[8]   Dr. Astrachan provides the following link which I used for my comparison with Java SE 5.0:
http://source.icu-project.org/repos/icu/icu4j/tags/release-2-
2/src/com/ibm/icu/text/RuleBasedCollator.java.
[9]   I have provided a full comparison of two class files in Appendix D.

by any other classes. In contrast, Sun defines RuleBasedCollator as a non-final class, which means that it can be extended by other classes.[10] This and other differences shown in the diff output found in Appendix D suggest to me that Oracle contributed to the creation of the RuleBasedCollator class in Java SE 5.0. In any event, however, I understand it is undisputed that Oracle owns the copyright to that class and the other classes in the java.text package.

VI.   THE LEONARD REPORT OVERLOOKS KEY BENEFITS OF THE JAVA PLATFORM

32.   Dr. Leonard argues that "[a]ny advantage Java offered over . . . other languages was small and also accompanied by disadvantages." (Leonard Report ¶100). In support, he cites Google's purported options for, and actual use of, other languages in the Android platform. He also lists other programming languages used across various mobile platforms, such as C#, C++, Javascript, Swift and Objective-C. (Leonard Report, ¶100, 103). While Dr. Leonard accurately points out the diversity of choices Google had in lieu of copying, he overlooks key advantages of the Java platform. An internal Google communication between Tim Lindholm and Andy Rubin explains that Google considered, and rejected, all alternatives:

> "What we've actually been asked to do (by Larry and Sergei [sic])
> is to investigate what technical alternatives exist to Java for
> Android and Chrome. We've been over a bunch of these, and
> think they all suck."[11]

A.   The Java Platform Includes Key Attributes

33.   The Java platform—including the Java API packages that serve as a rich and creative set of pre-defined software programs—is developer friendly. Among the many attractive features of the Java platform are the management of a virtual machine, which supports key attributes that enhance programmer productivity, as well as increased app security and robustness. For example, the Java platform supports garbage collection, bounds checking, and static type-checking. Garbage collection is a memory management mechanism that automatically reclaims and recycles objects not currently in use by an application. The garbage collector on the Java platform makes it easier to write applications by alleviating many tedious aspects of freeing

---

[10]   *See* https://books.google.com/books?id=W6SpffnfEPoC&pg=PA289&lpg=PA289&dq=%27extends +RuleBasedCollator%27&source=bl&ots=DRSqkSGUrE&sig=9Nm9Y5qv98llfvOUpgxzc3nHPVI&hl=en&sa =X&ved=0ahUKEwi-842X3ZPLAhUI2SYKHUahDCc4ChDoAQgbMAA#v=onepage&q='extends%20RuleBasedCollator'&f=false for an example of how the SpanishCollation class extends RuleBasedCollator.
[11]   TX10.

previously-allocated memory in languages like C and C++, which lack garbage collection. Bounds checking is a mechanism the Java platform uses to detect whether a variable used as an index in a Java collection (such as an ArrayList, Vector, or String that are part of the copied 37 Java API packages) is within the bounds of the collection, which is akin to overdraft protection that ensures a person does not bounce a check that's written for an amount larger than their current checking account balance. A failed bounds check triggers the generation of an exception (such as the IndexOutOfBoundsException that is also part of the copied 37 Java API packages), which can be handled properly by an application. Static type-checking provides a mechanism the Java platform provides to ensure the type safety of Java applications by catching many defects earlier in the software lifecycle, when they are easier and cheaper to fix. Collectively, these and other attributes of the Java platform make it easier for developers to write robust apps compared with using platforms that lack these attributes.

34.   Due to key attributes of the Java platform like those described above—combined with the Sun and Oracle's focus on "Write Once, Run Anywhere" compatibility and the expressiveness of the Java API packages—the Java platform has been one of the most popular and widely used development and runtime environments for the past two decades. As a result, many app developers are familiar with the Java API packages. The Java platform is also one of the most commonly taught environments in schools and universities around the world. Moreover, many tools are available for writing, refactoring, debugging, optimizing, and deploying apps developed for the Java platform.

35.   Figure 4 summarizes some of the unique aspects of the Java platform that made it the only platform with three critical attributes during the mid-2000s time frame: key client app-friendly development attributes, popularity with developers, and published specifications for the Java platform (including the copied 37 Java API packages) intended to ensure compatibility. Below I compare alternative platform approaches that Google had during this time frame against the benefits of the Java platform summarized in this figure.[12]

---

[12]   Empirical popularity data was sourced from the TIOBE Programming Community Index, which tracks the comparative popularity of different languages and platforms on a continuing basis. The chart in Figure 4 reflects the intersection of three factors: platform popularity, whether or not a given platform is client app developer friendly (i.e. largely intended for and applied to development of client-side apps with features like large set of utility core libraries, simplified/automated memory management, large set of extensions/libraries, and active community support), and whether or not a given platform is available

Figure 4: Popularity, App-Friendliness, and Openness of Leading Programming Language Options around 2006
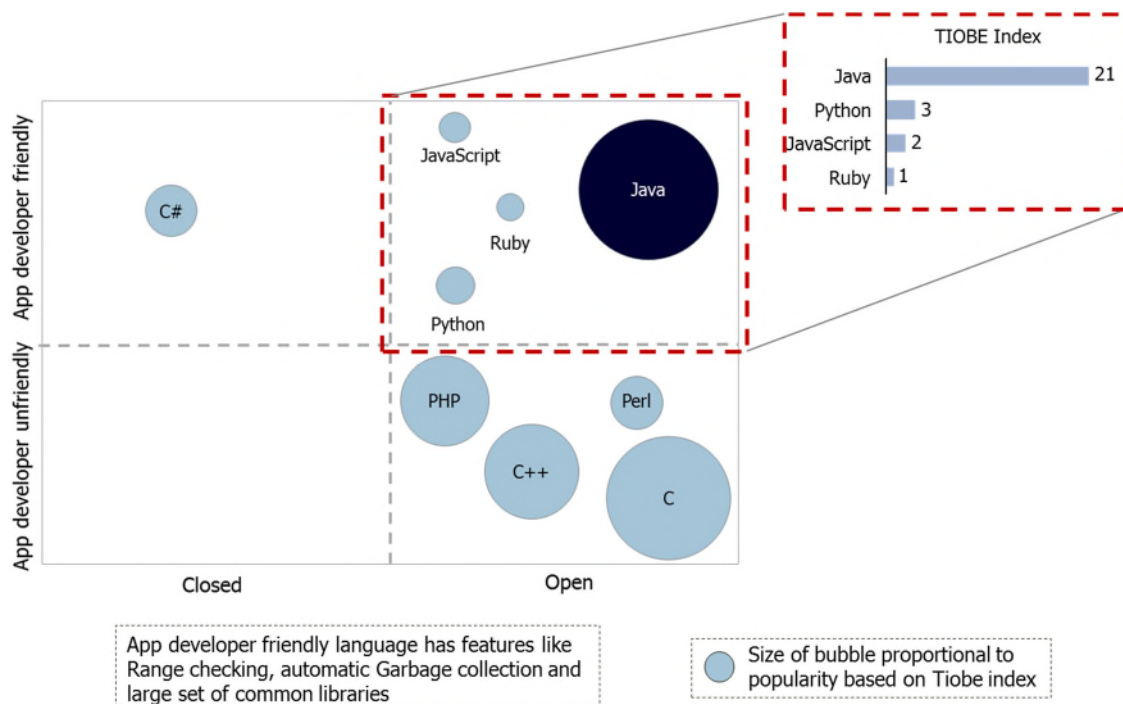

B.   Creation of Google's Own Arrangement of Classes and Methods Would Have Involved Time, Effort, and Technical Risk

36.   An individual API package is expressive through its declaring code and the constituent structure, sequence, and organization ("SSO") of its classes and methods—but a different API package with similar functionality could be created with classes and methods stemming from different declaring code and different SSO configurations.   The challenge and complexity of developing creative API packages can be seen in a number of projects arising in the context of the Java platform ecosystem dating back to the mid-1990s.

---

through some variety of open source access. With respect to popularity, average TIOBE scores for the year 2006 was used, and the corresponding popularity of a given language or platform is reflected in the proportional size of its bubble visualization. The graphic bubble for Java, which had a TIOBE ranking score of 21 in 2006, was accordingly 7 times the area of the graphic bubble for Python, which had a TIOBE ranking score of 3 during the same timeframe. With respect to app developer friendliness of a platform, platforms are placed in one of the two Northern quadrants of the chart, whereas non-client app developer friendly platforms are placed in either of the two Southern quadrants. Lastly, with respect to open access, platforms with some form of open access are placed in one of the two quadrants east of the vertical axis, while closed platforms are placed west of the vertical axis. Within an individual quadrant, position is not relevant—graphic bubbles are placed based on maximizing visual clarity for the reader. TIOBE ranking data is available at http://www.tiobe.com/tiobe_index (last accessed Feb. 29, 2016).

37.   For example, Java ACE is object-oriented concurrent network programming middleware developed under my guidance starting in 1996 together with my students at Washington University, St. Louis. Java ACE was an academic, non-commercial open-source research project that investigated the application of various design patterns in the context of the Java platform, including JDK 1.0, 1.1, and 1.2. It provided classes for building concurrent and networked software, including classes for event handler dispatching, dynamic (re)configuration of networked services, and support for concurrent execution and synchronization. Java ACE also implements several key design patterns for concurrent network programming, such as Acceptor-Connector and Active Object, which made it easier to develop concurrent and networked software using Java ACE compared to programming directly with the Java features and class libraries that were available at that time. Work on Java ACE preceded the integration of the java.util.concurrent package into JDK 5 by almost a decade.[13] As I describe in my Opening Report, from June 1996 to August 1999, my team of students and I devoted significant effort and creativity developing the Java ACE toolkit, which contained roughly 20,000 lines of Java code and about a dozen packages.

38.   ObjectSpace is another example of the effort and complexity involved in creating the types of expressions in the Java API packages. In 1997, ObjectSpace, Inc. released its Java Generic Library ("JGL"). Whereas Sun's Java Collections Framework released with JDK 1.2 in 1998 were arranged into packages of classes and methods, the JGL is organized based on "containers" of data structures, using design patterns guided by the C++ Standard Template Library ("STL"). JGL is more than simply one different arrangement of Java code—it is a gateway to vast diversity of Java utilization. An article from the time period explains:

> The combinations are almost endless. You may think they are far from infinite because the roughly 20 types of Containers, multiplied by roughly 40 algorithms, produces some 800 different combinations. In fact, this number ends up looking very small when you factor in the extra dimension of function objects that can customize most of the algorithms.[14]

---

[13]   JDK 5.0 incorporated concurrency utilities in November, 2004.
http://www.ibm.com/developerworks/java/tutorials/j-concur/j-concur.html.
[14]   http://www.javaworld.com/article/2076958/java-app-dev/need-a-good-set-of-abstract-data-structures--objectspace-s-jgl-packs-a-punch-.html.

39.   Java ACE and JGL both required significant expenditures of time and effort to develop as nascent frameworks. Java, however, has evolved far beyond a rudimentary syntactic framework into a large and intricate cascading array of thoughtfully designed API packages. The declaring code and organization of the API packages developed by Sun—as well as the complex interactive relationships between these packages—were created over time in a deliberate manner designed to maximize their appeal, usability, and efficiency. In contrast, had Google hastily created lines of declaring code and organization it would likely not have been optimal, from a developer standpoint, as that material would not, in general, have had the time to mature and stabilize given the tight schedule Google had imposed for releasing Android. Also, had Google created its own declaring code and SSO of the copied API packages it would have incurred significant time, effort, and risk as it sought to enter the competitive and fast-paced mobile device marketplace. As explained by Andy Rubin, Google's pursuit of quick market entry needed to go to "extraordinary lengths."[15] He explains:

> [Y]ou have a window of opportunity in smartphones . . . . You have to ship as soon as feasibly possible. I mean, you go to extraordinary lengths to ship sooner, because it's a very dynamic market. And it could shift directions at any time . . . . So my job . . . was to just do everything that I possibly could to get my solution to the market in the shortest time possible.[16]

40.   The quote from Andy Rubin above indicates that the creation of a wholly new platform by Google would probably not have been an acceptable alternative because there was insufficient time to build a platform with portability and compatibility that the Java platform had attained by the mid-2000s. In general, developing a new platform instead of using the Java API Packages would have involved substantial time, effort, and technical risk. For this reason as well, building a new platform in the space of a couple years was unlikely to be an acceptable alternative. As discussed below, other examples illustrate that such a short timeframe offers too narrow a window for technically proficient development, even in the most skilled settings.

41.   For example, since 2010, Apple has been developing Swift, an open-source language platform intended to serve as an efficient, developer-friendly, compatible alternative to C, C++,

---

[15]   Personal Capacity Deposition of Andrew E. Rubin, July 27, 2011, p. 180.
[16]   *Ibid*.

and Objective-C.[17] Swift 1.0 was released in late 2014, and was eventually made open source in late 2015.[18] The next version, Swift 3.0, is planned for release in late 2016. However, after more than 6 years of development, the Swift platform is yet to stabilize or offer binary compatibility.[19] In addition to these shortcomings, full source compatibility, language support for concurrency, and C++ interoperability are considered "out of scope" in the immediate future.[20]

42.   Even Google has developed several of its own programing languages, including Go and Dart. Go has the stated goal of combining "the ease of programming of an interpreted, dynamically typed language with the efficiency and safety of a statically typed, compiled language"[21] and is designed to provide concurrency and garbage collection in distributed network contexts.[22] Dart is used for building web, server, mobile applications, and Internet of Things ("IoT") devices. Go's development began in 2007 and its development became publicly sourced starting in 2009. Likewise, Dart's development began in 2011, and it first appeared publically near the end of 2013. Go and Dart, like Swift, have been subject to long development time frames, e.g., Go 1.0 was finally released in 2012.[23] Despite the infrastructure and obvious incentive to have control over the language base of its products, Go and Dart have yet to achieve viable status as an obvious choice for app development—along with some important shortcomings, they lack the necessary penetration of the developer community to justify adoption as an operating platform of choice for mobile apps.[24] Moreover, Google recently announced that the Dart virtual machine would not be integrated into its Chrome browser.[25]

See also TIOBE page, http://www.tiobe.com/news/10/java-language-of-year-2015: "Apple's announcement to replace Objective-C by Swift some time ago was the main cause of this fall. It was expected that Swift would gain as much popularity as Objective-C left behind, but that doesn't appear to be the case. This is also observed in practice: TIOBE's customers are not eagerly migrating to Swift yet."

C.   Use of Other Existing Platforms Would Have Involved Time, Effort and Technical Risk

43.   While a number of different language platforms offered useful features in the mid-2000s, none combined the value of an app-developer-friendly platform with published specifications (including the copied 37 Java API Packages) intended to ensure compatibility that was widely adopted by a large number of app developers. For these and additional reasons discussed below, existing alternate language platforms would not have been—and in fact were not—an acceptable alternative to meet Google's needs.

44.   JavaScript (which, despite its name, is unrelated to the Java programming language) is widely used for the client-side functionality of web browsers. However, its inefficient execution and low-level of adoption in the mid-2000s made JavaScript unsuitable for mobile applications, compared with Java.

45.   Lua and Ruby are multi-paradigm language platforms developed in the early/mid 1990s that blend elements of both functional and object-oriented languages.[26] They also offer a modicum of portability since programs written in Lua and Ruby can be compiled across a number of different platforms. Despite these features, however, their utility was highly constrained in the mid-2000s by lack of broad adoption in the mobile app domain and inefficient execution. For example, method calls in Ruby are dispatched dynamically, where each one of a module's ancestors are examined in turn, stopping at the first module that contains a method with the name that was called. In contrast, Java method calls are dispatched more efficiently.[27]

46.   Similar to both JavaScript and Lua, Python did not have appreciable developer adoption in the mid-2000s time frame. Moreover, while Python offered many features of managed languages, it suffers from similar performance drawbacks as JavaScript. For example, its reference implementation cannot efficiently take advantage of multi-core processors. In contrast, the Java Virtual Machine has been optimized for multi-core processing, which has grown

---

[27]   *See* https://docs.oracle.com/javase/specs/jvms/se7/html/jvms-2.html#jvms-2.7 for an overview of how some of Oracle's implementations of the Java Virtual Machine implement a table containing the methods of an object.

increasingly prominent in the years since 2006.[28] Many Android phones are powered by multi-core processors.[29]

47.   More widely used language platforms were also handicapped by critical shortcomings. In particular, C# and Visual Basic offer managed language solutions of crafted APIs whose .NET hierarchies and frameworks can be deployed across a range of Windows platforms. The C# and Visual Basic languages, however, are proprietary to Microsoft, and their integration into a Google platform would have thus required some sort of licensing agreement.

48.   C and C++ are both popular languages with long histories of testing and development. C++ provides object-oriented extensions to C, and most C++ compilers can compile most valid C programs. However, both C and C++ lack key attributes (such as automated garbage collection and bounds checking) that are beneficial to enhancing the productivity and robustness of apps written by developers.

49.   Objective-C, the language platform of the iOS ecosystem, has similar limitations to C and C++, including lack of automated garbage collection and bounds checking. Moreover, it was not widely used outside of the Apple ecosystem in the mid-2000s, compared with Java, which was much more widely adopted during that time period.

50.   PHP and PERL are popular scripting languages that are largely intended for—and applied to—server-side web development, rather than for the development of client-side apps. They are weakly typed, lack a published specification, and had little to no user base for mobile app development in the mid-2000 time frame, all of which made them unsuitable as the basis for Android app development.

51.   As evident from the examples above, as well as in the information captured earlier in Figure 4, the other non-Java platform options for Google during the mid-2000s were not as beneficial as the Java platform. Different platforms offered varying aspects of key attributes, but only the Java platform offered the key app developer friendly attributes such as automated

[28]   *See* http://www.intel.com/pressroom/kits/quickrefyr.htm#2006 for a timeline of when Intel's commercial processors began to support multi-core capabilities.
[29]   *See* https://developer.qualcomm.com/blog/multi-threading-android-apps-multi-core-processors-part-1-2 for discussions on multi-core programming in Android using various Java and Android programming constructs.

garbage collection, bounds checking, static type checking, published specifications for the platform (including the copied 37 Java API packages) intended to ensure compatibility, and large-scale adoption by programmers. The experiences of Apple and Google demonstrate how time consuming it is for one company to develop and promote a platform using a new language that achieves widespread adoption by millions of developers. Viewing these events retrospectively highlights Sun's achievement in creating a complex, dynamic programming platform with enduring utility and expressive potential.

VII. THE ANDROID PLATFORM IS INCOMPATIBLE BASED ON THE JAVA COMPATIBILITY KIT FOR JAVA SE 1.4 AND JAVA SE 5.0

52.   I understand that the District Court recently ruled that the question of infringement will, for the time being, be limited to Google's copying of code up through Java SE 5.0.[30] Although I understand that the Court clarified that other versions of Java SE may still be relevant for other purposes, out of an abundance of caution, I have reviewed updated tests in response to Dr. Astrachan's critique of Android compatibility.

53.   When the Signature Test was rerun using earlier versions of the Java Compatibility Kit, the results were the same. As detailed in the section below, including Tables 3 and 4, as well as Appendix E, Android fails the Signature Test for these earlier versions.

54.   I understand from the declaration of Dr. Mark Reinhold, Chief Architecture of the Java Platform Group at Oracle, that Android API Level 9 (Gingerbread) and Android API Level 21 (Lollipop) each failed to pass the Java Compatibility Test for Java SE 1.4 and Java SE 5.0.

---

[30] I understand that it is undisputed that Google copied the 37 Java API Packages for all versions of Android up to and including Android Marshmallow (API Level 23). Moreover, I note that Dr. Astrachan does not challenge Mr. Zeidman's opinions that Android Auto, Android TV, and Android Wear include the copied 37 Java API packages. To be sure, the websites cited in Mr. Zeidman's report (¶29) (http://developer.android.com/training/auto/start/index.html; http://developer.android.com/training/tv/start/start.html; http://developer.android.com/training/wearables/apps/creating.html) make clear that the SDK for versions of Android that include the 37 Java API Packages—which Google distributes—are necessary to write applications for those products. Thus, when an app developer wishes to write an application for Android Auto, TV, or Wear, the developer must download (to the extent they do not already have it) and use the SDK. Moreover, the practical result of this requirement means that those versions of Android runtime (which again, undisputably include the copied 37 Java API Packages) must be included in Google's distribution of Android Auto, Android TV, and Android Wear.

55.   The Java Compatibility Kit ("JCK") is Java's official test suite for determining compatibility. It is used by Oracle to confirm compatibility of alleged implementations of Java with the adopted specifications of the JCP.[31] I understand that failure of any one JCK test means that the tested implementation is not compatible with the corresponding Java SE Specification.

56.   A key test within the JCK is the Signature Test, which uses static analysis to determine whether or not an alleged implementation of a Java API contains the correct number of classes, methods, interfaces, and fields. The test outputs a listing of missing and/or added class(es), constructor(s), field(s), method(s), nested class(es), super class(es), interface(s), and annotation element(s), each of which constitutes an error. I understand from Dr. Reinhold's Reply Declaration that any errors qualify an implementation as incompatible, i.e., any missing or added element renders the implementation incompatible. In particular, any missing element indicates the alleged implementation of Java represents a "subset" of the Java platform. Likewise, any added element indicates the alleged implementation of Java represents a "superset" of the Java platform.

57.   It is my understanding that Dr. Reinhold used the JCK Signature Test to evaluate the compatibility of Android API Level 9 (Gingerbread), released in 2011, with both Java SE 1.4 and Java SE 5.0. Specifically, he ran the Java SE 1.4 and Java SE 5.0 JCK Signature Tests on the Android Gingerbread release.

58.   It is my understanding that Dr. Reinhold also used the JCK Signature Test to evaluate the compatibility of Android API Level 21 (Lollipop), released in 2014, with both Java SE 1.4 and Java SE 5.0. Specifically, he ran the Java SE 1.4 and Java SE 5.0 JCK Signature Tests on the Android Lollipop release.

59.   Dr. Reinhold found that Android Gingerbread's implementation of the Java APIs in the Java SE 1.4 runtime failed to pass the Java SE 1.4 JCK, generating a total of 1,703 errors for

---

[31]   *See* https://jcp.org/en/resources/tdk, (last visited January 7, 2016), for a page on the Java Community Process (JCP) website describing how Specification Leads for JSRs obtain access to JCK testing tools; *see* http://openjdk.java.net/groups/conformance/docs/JCK6bUsersGuide/ JCK6b_Users_Guide.pdf (last visited January 7, 2016) for a copy of the user's guide for version 6b of the Java Compatibility Kit.

missing or added signatures.[32]   The results of this analysis are presented in Table 3, below, organized by type of error and package name.

Table 3: Summary of Error Types for the 37 Copied API Packages for "Added" and "Missing" Errors from the Java SE 1.4 JCK against Android API Level 9 (Gingerbread)[33]

Package Name	Error Type						
	Class		Method		Other		
	Added	Missing	Added	Missing	Added	Missing	Total
java.awt.font	0	16	0	0	7	0	23
java.beans	1	32	3	0	0	0	36
java.io	25	0	43	15	20	4	107
java.lang	21	1	197	14	77	0	310
java.lang.annotation	10	0	0	0	0	0	10
java.lang.reflect	15	0	40	2	0	0	57

javax.security.auth.callback	0	6	0	0	0	0	6
javax.security.auth.login	0	7	0	0	0	0	7
javax.security.auth.x500	0	1	1	0	1	0	3

[32]   Dr. Reinhold also found that Android Gingerbread failed to pass the Java SE 5.0 JCK, generating a total of 1,467 errors. The results of this analysis are provided in Appendix E.
[33]   "Other" errors are JCK errors that relate to added or missing constructors and fields. Annotations are not included because Java SE 1.4 does not support annotations.

| Package Name | Error Type | | | | | | |
| | Class | | Method | | Other | | |
	Added	Missing	Added	Missing	Added	Missing	Total
javax.sql	8	2	113	0	0	0	123
Total	235	76	912	99	204	177	1703

60.   Likewise, Dr. Reinhold found that Android Lollipop's implementation of the Java APIs in the Java SE 5 runtime failed to pass the Java SE 5.0 JCK, generating a total of 1,800 errors for missing or added signatures.[34] The results of this analysis are presented in Table 4, below, organized by type of error and package name.

Table 4: Summary of Error Types for the 37 Copied API Packages for "Added" and "Missing" Errors from the Java SE 5.0 JCK against Android API Level 21 (Lollipop)[35]

| Package Name | Error Type | | | | | | |
| | Class | | Method | | Other | | |
	Added	Missing	Added	Missing	Added	Missing	Total
java.awt.font	1	16	0	1	7	0	25
java.beans	0	32	0	0	0	0	32

61.   Table 5, below, illustrates that Android Lollipop's failures of the JCK Signature Test arise at least from its use of subsets of classes compared to Java SE 5.0. Because subsetting involves the removal of classes defined in the Java SE API specification, it will always result in failure of the JCK Signature Test.

Table 5: Summary of Manual Evaluation of "Missing" Method Errors from the Results of the Java SE 5.0 JCK Test against the Android Lollipop Runtime Implementation

Class Name	Missing JCK Signatures from Lollipop Test	Java SE 5 Signature and Line Number
Java.lang.Inet4Address	method public final boolean equals(java.lang.Object)	Inet4Address.java, Line 331: *public boolean equals(Object obj)*
Java.security.UnresolvedPermission	method public final int hashCode()	UnresolvedPermission.java, Line 387: *public int hashCode()*
Java.text.BreakIterator	method protected static int getInt(byte[],int)	BreakIterator.java, Line 585: *protected static int getInt(byte[] buf, int offset)*
Java.awt.font.TextAttribute	method protected final java.lang.Object readResolve() throws java.io.InvalidObjectException	TextAttribute.java, Line 107: *protected Object readResolve() throws InvalidObjectException*

Class Name	Missing JCK Signatures from Lollipop Test	Java SE 5 Signature and Line Number
Java.net.SocketPermission	method public final int hashCode()	SocketPermission.java, Line 714: *public int hashCode()*
Java.text.CollationKey	method public final int compareTo(java.lang.Object)	CollationKey.java, Line 94: *public int compareTo(CollationKey target)*
Java.util.ResourceBundle	method public static final java.util.ResourceBundle getBundle(java.lang.String)	ResourceBundle.java, Line 548: *public static final ResourceBundle getBundle(String baseName)*
Java.text.DecimalFormatSymbols	method public final java.lang.String getInternationalCurrencySymbol()	DecimalFormatSymbols.java, Line 240: *public String getInternationalCurrencySymbol()*

62.   Likewise, Table 6, below, illustrates that Android's Lollipop's failures of the JCK Signature Test also stem from its use of supersets of classes compared to Java SE 5.0. Since supersetting involves the addition of superfluous classes that are not defined in the Java SE API specification, it will always result in failure of the JCK Signature Test.

Table 6: Summary of Manual Verification of "Added" Errors from the Results of the Java SE 5.0 JCK Test against the Android Lollipop Runtime Implementation

Class Name	Added JCK Signatures from Lollipop Test	Android Lollipop Signature and Line Number
Java.io.File	method public long getFreeSpace()	File.java, Line 1166: *public long getFreeSpace()*
Java.net.HttpURLConnection	method public void setFixedLengthStreamingMode(long)	HttpURLConnection.java, Line 760: *public void setFixedLengthStreamingMode(long contentLength)*

Class Name	Added JCK Signatures from Lollipop Test	Android Lollipop Signature and Line Number
Java.nio.Buffer	method public abstract int arrayOffset()	Buffer.java, Line 134: *method public abstract int arrayOffset()*
Java.security.Policy	method public static java.security.Policy getInstance(java.lang.String,java.security.Policy$Parameters)	Policy.java, Line 33: *public static Policy getInstance(String type, Policy.Parameters params) throws NoSuchAlgorithmException*
Java.sql.Blob	method public abstract java.io.InputStream getBinaryStream(long,long) throws java.sql.SQLException	Blob.java, Line 54: *public InputStream getBinaryStream(long pos, long length) throws SQLException;*
Java.text.NumberFormat	method public void setRoundingMode(java.math.RoundingMode)	NumberFormat.java, Line 846: *public void setRoundingMode(RoundingMode roundingMode)*
Java.util.BitSet	method public int previousClearBit(int)	BitSet.java, Line 636: *public int previousClearBit(int index)*
Java.sql.Connection	public abstract java.sql.SQLXML createSQLXML() throws java.sql.SQLException	Connection.java, Line 785: *public SQLXML createSQLXML() throws SQLException;*

63.   Android's implementation of the Java APIs fail the JCK Signature Tests because it represents both a subset and superset of the Java SE API Specification. In doing so, Android deviates from the compatibility standards imposed by the JCK test suite.

VIII. OTHER ISSUES

A.   Dr. Leonard Overstates the Capabilities and Efficacy of Native Code Tools, such as the Native Development Kit ("NDK")

64.   In his report, Dr. Leonard argues that "[a] substantial number of applications, including many of the most popular applications offered through the Google Play store, were in fact

developed using the NDK." (Leonard Report, ¶76).   But Dr. Leonard's statement directly contradicts those of Google. In one of Google's recent tutorial on its Android Runtime ("ART") environment, Anwar Ghuloum, Engineering Manager for Android's Runtimes & Tools team at Google, explains:

> [about] 85% of applications in Play [i.e., the Google Play Store]
> are comprised exclusively of dex bytecode and use no native code.[36]

65.   To further understand the extent to which Android apps use the NDK, I classified the applications listed in Dr. Leonard's Exhibit 2b and found that his sample of applications is not an accurate representation of the type of applications found in the "Top Applications" in the Android Play Store. [37] Instead, Dr. Leonard's list is heavily weighted towards gaming applications. A comparison of the distribution of applications in Dr. Leonard's Exhibit 2b to the list of top applications in the Android Play Store is shown in Figure 5.

Figure 5: Distribution of Dr. Leonard's list of apps Compared to Top Android Apps

---
36   *See* "Google I/O 2014 - The ART Runtime," Jun. 27, 2014, at 37:30
https://www.google.com/events/io/io14videos/b750c8da-aebe-e311-b297-00155d5066d7.
37   For comparision, I classified the list provided by Dr. Leonard in Exhibit 2b of his Expert Report and the list of apps provided by Dr. Kemerer in his Opening Report (Kemerer Opening Report Appendix D and E) into categories. List of apps and their classifications are provided in Appendix F.

66.   Not only is Dr. Leonard's sampling of apps questionable, but his classification of applications as "NDK" is also suspect. It is my understanding that Dr. Kemerer, in his February 29, 2016 Reply Report, analyzed the source code content of selected applications from Dr. Leonard's Exhibit 2b and found inaccuracies in his source classification. In particular, it is my understanding that Dr. Kemerer found that a number of applications that Dr. Leonard describes as being written in native code contain significant amounts of Java code.[38] Moreover, it is my understanding that Dr. Kemerer in his opening report found that the top apps in the Android play store actually depend on the 37 copied API packages.

67.   The presence of Java code in these applications, is consistent with Google's own statements on the utility of the NDK. The Android NDK website explains: "Before downloading the NDK, you should understand that **the NDK will not benefit most apps**."[39] (emphasis in original).

B.   Dr. Leonard Overstates the Cross-Platform Support Enabled by Tools, such as RenderScript

68.   In his report, Dr. Leonard discusses RenderScript as an example of a Google supported framework for the C programming language (Leonard Report, ¶76). It is worth noting that RenderScript is being deprecated for use as a graphics engine, which is the usage that Leonard quotes above.[40] Moreover, a search of all of Android's frameworks and packages for RenderScript code results in only a small number of uses, compared to the substantial uses of Java throughout Android.

69.   Finally, a search of Google-sanctioned training courses demonstrates the unimportance of RenderScript. Google has teamed up with Udacity to co-create a "Nanodegree"[41] on Android app

---

[38]   It is also interesting to note that Dr. Kemerer found that some of the apps that Dr. Leonard had classified as written in NDK to have higher counts of Java source lines of code compared to the ones he actually classified as being written in Java.

[39]   Android NDK, Android Developers, http://developer.android.com/tools/sdk/ndk/index.html. (This site further explains, "As a developer, you need to balance its benefits against its drawbacks. Notably, using native code on Android generally does not result in a noticable [sic] performance improvement, but it always increases your app complexity.")

[40]   *See* http://developer.android.com/guide/topics/renderscript/reference/rs_graphics.html and https://commonsware.com/blog/2012/07/03/jelly-bean-renderscript-deprecation.html. However, RenderScript is still used as a compute engine in a few places in Android.

[41]   Udacity is an educational organization that offers online courses through its website, known as Massively Open Online Courses ("MOOCs"). Udacity is considered one of the dominant providers of

---

programming. A search of the Udacity website for "renderscript android" results in zero hits. It is reasonable to conclude that because Google's own sanctioned training for Android app development does not focus on RenderScript, Google itself must not consider RenderScript relevant for learning to program Android apps.[42]

C.   Dr. Astrachan Continues to Overstate the Connection Between the Java Programming Language and the 37 Java Packages

70.   In his Rebuttal Report, Dr. Astrachan continues to claim that "the Java programming language is inextricably intertwined with the use of underlying class libraries."[43] This sentiment is echoed in Dr. Leonard's report, which constantly conflates the Java programming language with the APIs at issue.[44]

71.   I have reviewed TX1062, which is described as "classes and interfaces mentioned in the Java Language Specification (third edition) (excluding examples and commentary)." While the classes listed in TX1062 are, in fact, mentioned in the Java Language Specification (3rd ed.) ("JLS"), very little declaring code or SSO is specified in the JLS. In other words, even if I were to accept the premise that code elements mentioned in the JLS were necessary (or "inextricably intertwined") with the Java programming language, very little declaring code or SSO is actually mentioned. For example, as I have described previously, classes in the 37 Java API Packages include numerous methods, constructors, fields, or other elements. In most instances, the JLS simply requires the *presence* of a class of a particular name; the JLS does not specify nor require the constituent parts of that class, nor the relationships between classes and interfaces.

MOOCs (*see* http://www.nytimes.com/2012/11/04/education/edlife/the-big-three-mooc-providers.html?_r=0), currently boasting over 1.6 million subscribed users (*see* http://www.fastcompany.com/3021473/udacity-sebastian-thrun-uphill-climb), with a more recent particular focus on vocational courses for professionals, which are called "Nanodegrees." *See* https://www.udacity.com/nanodegrees-new-s/nd801 for information on the Android Nanodegree that Udacity co-created with Google.

[42]   The unimportance of RenderScript is further highlighted by a statement made by a senior engineer on stackoverflow: *"You can see from the lack of answers that Renderscript is hardly used outside of Google because of its strange architecture that ignores industry standards like OpenCL and almost non-existent documentation on how it actually works."* http://stackoverflow.com/questions/21774211/render-script-rendering-is-much-slower-than-opengl-rendering-on-android.

[43]   Astrachan Rebuttal Report ¶104.

[44]   *See, e.g.*, Leonard Report ¶100.

72.   I understand that Dr. Reinhold has reviewed whether any declaring code or SSO is subject to a technical constraint imposed by the JLS and has made a list of any such code. I have reviewed and independently verified Dr. Reinhold's list. To the extent these declarations appear in Exhibit S of Mr. Zeidman's Opening Report, these declarations would be subject to a technical constraint imposed by the JLS. (Conversely, copied lines of code not present on the list are not constrained by the JLS.) Thus, even if one were to assume that elements of the 37 Java API Packages mentioned in the JLS are necessary to the language (which I do not agree with), it affects very little of what Google has copied in this case. Appendix H includes Dr. Reinhold's list of constrained declarations from the 61 classes of TX1062. Appendix I shows the copied SSO, removing the relationships described in the JLS.

D.   Dr. Astrachan Mischaracterizes Certain Elements of the Android Compiler and Runtime Environment

73.   In his Rebuttal Report, Dr. Astrachan argues that the dex compiler is not, in fact, a compiler. (Astrachan Rebuttal Report, §IV-D-1). I disagree with this assertion since the Android dx tool comments specifically reference compilation activity.   The author comment lines, excerpted below, read:

> dalvik/dx/src/com/android/dx/command/dexer/Main.java:1269
> /** Whether to print statistics to stdout at end of *compile cycle* */
> dalvik/dx/src/com/android/dx/dex/cf/CfOptions.java:44
> /** whether to print statistics to stdout at end of *compile cycle* */[45]
>
> (emphasis added)

74.   Dr. Astrachan's rebuttal report also claims that "ART is not a virtual machine because it does not do runtime interpretation of bytecode." (Astrachan Rebuttal Report, §154) I disagree with this claim based on my analysis of the ART source code, documentation, and tutorials presented on ART by Google engineers. First, ART contains functionality that *does* perform runtime interpretation of bytecode, which resides in the art/runtime/interpreter folder in Android releases K, L, M, and also exists in the Android master branch.[46] Moreover, the Android documentation describes how to generate bytecode for the ART interpreter, where it explicitly describes how/when the interpreter is enabled.[47]

---

[45]   *See* https://android.googlesource.com/platform/dalvik/+/master/dx/src/com/android/dx/dex/cf/CfOptions.java.

[46]   *See* https://android.googlesource.com/platform/art/+/master/runtime/interpreter/.

[47]   *See* https://source.android.com/devices/tech/dalvik/configure.html#compiler_filtersm.

In L, dex2oat takes a variety of --compiler-filter options to control how it compiles. Passing in a compiler filter flag for a particular app specifies how it's pre-optimized. Here's a description of each available option:

- everything - compiles almost everything, excluding class initializers and some rare methods that are too large to be represented by the compiler's internal representation.
- speed - compiles most methods and maximizes runtime performance, which is the default option.
- balanced - attempts to get the best performance return on compilation investment.
- space - compiles a limited number of methods, prioritizing storage space.
- interpret-only - skips all compilation and relies on the interpreter to run code.

75.   Finally, in the 2014 Google I/O tutorial on "The ART Runtime," a Google engineer states "we also just do dex-to-dex for things that are not commonly run, such as class initializers, which we don't waste time or space compiling."[48] This statement is consistent with the "everything" option in dex2oat tool quoted above, which "compiles almost everything, excluding class initializers."

E.   Dr. Astrachan Overstates his Claim that Android will not build when the declaring code for a single method in one of the 117 Android API packages is removed

76.   In both of his reports, Dr. Astrachan insists that all the declaring code copied by Android is essential for access to the Java language.[49] Specifically, he insists that every single declaration from the 117 Android API packages is necessary for a successful build (Astrachan Rebuttal Report, ¶82). There are, however, examples of declaring code in the 117 Android API packages that contain declaring code that is not needed in order to build a flashable image of the Android platform.

77.   I performed build tests to verify that not all declaration code from the 117 Android API packages must necessarily be present in the Android source code to permit a successful build. I performed these tests using Android 2.3, release 1 (Gingerbread, API level 9), and using the same

---

[48]   *See* https://www.google.com/events/io/io14videos/b750c8da-aebe-e311-b297-00155d5066d7 starting at 12:14.
[49]   *See*, *e.g.*, Astrachan Opening Report, ¶¶162, 169-172; Astrachan Rebuttal Report, ¶¶78-92, 94-96.

environment and tools from the test methodology outlined in my initial report (Opening Report, §VIII-B).

78.   For my test, I followed Dr. Astrachan's methodology of removing one method declaration at a time. In particular I removed the same method from the same class that Dr. Astrachan tests in his own report (Astrachan Rebuttal Report, ¶80-81) namely, "pingSupplicant()" from the WifiManager class in the android.net.wifi package.[50] I found that this build completed successfully and without any errors. See Appendix J for the full log of this build test.

79.   The results of this build test refutes Dr. Astrachan's claim that "any and all components are significant to the build process" (Astrachan Rebuttal Report, ¶56) since I found at least one declaration from the 117 Android API packages that is not necessary to build Android.

F.   Dr. Astrachan Continues to Overlook the Portability Enabled by the Java Platform

80.   Dr. Astrachan's report fixates on the nature of "Write Once, Run Anywhere" as "just that— a philosophy." (Astrachan Rebuttal Report, ¶133).   This reductive assessment overlooks the attributes recognized by millions of developers—for more than two decades—amidst a constantly evolving landscape of hardware advancement, market upheavals, globalized competition, and dynamic consumer engagement. He continues, arguing, "Far from guaranteeing portability, Java has been criticized by the programming community, which adopted the phrase 'write once, debug everywhere' to describe Java." (Astrachan Rebuttal Report, ¶133).

81.   In reading the source cited by Dr. Astrachan, however, it is apparent that he has oversimplified the depth of the author's analysis, focusing solely on the wording of the blog post's title.[51] The author writes:

> The bulk of a Java application will migrate between most Java implementations, but taking advantage of a VM-specific feature

---

[50]   For this Android build I modified the XML document in the source code that specifies the API by removing the method specification for pingSupplicant(), and updated the API specification based on this modified documentation. The XML document is frameworks/base/api/9.xml, and the command used to update the API specification is "make update-api." I also removed directories from the Android source code that contain resources that are used for compatibility and development testing. These resources are not directly used by the Android operating system, and their presence is not required to successfully build Android. The test directories removed for these tests are the cts/ and frameworks/base/tests folders.
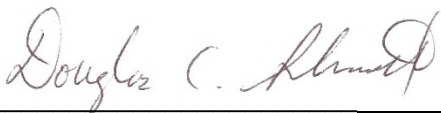

[51]   *See* Wong, W., "Write Once, Debug Everywhere," Electronic Times, http://electronicdesign.com/embedded/write-once-debug-everywhere.

> causes porting problems… Unfortunately, porting problems will always be with us. The trick is to minimize the problems so developers can concentrate on the application.[52]

82.   One article by a single author with a provocative title is not the equivalent of "criticism from the programming community," which is a community that amounts to millions of developers.[53] More critically, however, the article author's main point seems to be that "taking advantage of VM-specific features will cause porting problems," which of course is correct, but misses the efforts put into "Write Once, Run Anywhere", evidenced by the fact that Sun and Oracle have, for more than 20 years, published portability guides and other tools to help developers avoid these VM-specific problems. In fact, Sun and Oracle have done exactly what the author recommends: minimize the problems so that developers can concentrate on application development. While it is hard to achieve complete portability, to use flawless portability as a binary threshold of evaluation clearly misses the point that programming is a creative, expressive art involving numerous choices, tradeoffs, and complex decisions. Moreover, it also misrepresents the fact that the bulk of Java applications port smoothly between Java implementations that have successfully passed the JCK test suites.

IX.   ATTESTATIONS

83.   I declare under penalty of perjury under the laws of the United States of America that the foregoing is true and correct. Executed on this 29th day of February, 2016, in Nashville, TN.

Douglas C. Schmidt, Ph.D.

 31 -/**
 32 - * <p>RuleBasedCollator is a concrete subclass of Collator. It allows
 33 - * customization of the Collator via user-specified rule sets.
 34 - * RuleBasedCollator is designed to be fully compliant to the <a
 35 - * href="http://www.unicode.org/unicode/reports/tr10/"> Unicode
 36 - * Collation Algorithm (UCA)</a> and conforms to ISO 14651.</p>
 37 +/*
 38 + * @(#)RuleBasedCollator.java  1.37 03/12/19
 39   *
 40 - * <p>Users are strongly encouraged to read <a
 41 - * href="http://oss.software.ibm.com/icu/userguide/Collate_Intro.html">
 42 - * the users guide</a> for more information about the collation
 43 - * service before using this class.</p>
```

```
44 - *
45 - * <p>Create a RuleBasedCollator from a locale by calling the
46 - * getInstance(Locale) factory method in the base class Collator.
47 - * Collator.getInstance(Locale) creates a RuleBasedCollator object
48 - * based on the collation rules defined by the argument locale.  If a
49 - * customized collation ordering ar attributes is required, use the
50 - * RuleBasedCollator(String) constructor with the appropriate
51 - * rules. The customized RuleBasedCollator will base its ordering on
52 - * UCA, while re-adjusting the attributes and orders of the characters
53 - * in the specified rule accordingly.</p>
54 - *
55 - * <p>RuleBasedCollator provides correct collation orders for most
56 - * locales supported in ICU. If specific data for a locale is not
57 - * available, the orders eventually falls back to the <a
58 - * href="http://www.unicode.org/unicode/reports/tr10/">UCA collation
59 - * order </a>.</p>

90 +/**
91 + * The <code>RuleBasedCollator</code> class is a concrete subclass of
92 + * <code>Collator</code> that provides a simple, data-driven, table
93 + * collator.  With this class you can create a customized table-based
94 + * <code>Collator</code>.  <code>RuleBasedCollator</code> maps
95 + * characters to sort keys.
96 + *
```

```
 97 + * <p>
 98 + * <code>RuleBasedCollator</code> has the following restrictions
 99 + * for efficiency (other subclasses may be used for more complex
languages) :
100 + * <ol>
101 + * <li>If a special collation rule controlled by a &lt;modifier&gt; is
102 +       specified it applies to the whole collator object.
103 + * <li>All non-mentioned characters are at the end of the
104 + *      collation order.
105 + * </ol>
106   *
107 - * <ul>
108 - * <li>According to the JDK documentation:
109 - * <i>
110 - * <p>
111 - * Modifier '!' : Turns on Thai/Lao vowel-consonant swapping. If this
rule
112 - * is in force when a Thai vowel of the range &#92;U0E40-&#92;U0E44
precedes a
113 - * Thai consonant of the range &#92;U0E01-&#92;U0E2E OR a Lao vowel of
the
114 - * range &#92;U0EC0-&#92;U0EC4 precedes a Lao consonant of the range
115 - * &#92;U0E81-&#92;U0EAE then the
116 - * vowel is placed after the consonant for collation purposes.
117 - * </p>
118 - * <p>
119 - * If a rule is without the modifier '!', the Thai/Lao vowel-consonant
120 - * swapping is not turned on.
121 - * </p>
122 - * </i>
123   * <p>
124 - * ICU4J's RuleBasedCollator does not support turning off the Thai/Lao
125 - * vowel-consonant swapping, since the UCA clearly states that it has
to be
126 - * supported to ensure a correct sorting order. If a '!' is
encountered, it is
127 - * ignored.
128 - * </p>
129 - * <li>As mentioned in the documentation of the base class Collator,
130 - *      compatibility decomposition mode is not supported.
131 + * The collation table is composed of a list of collation rules, where
each
132 + * rule is of one of three forms:
133 + * <pre>
134 + *    &lt;modifier&gt;
135 + *    &lt;relation&gt; &lt;text-argument&gt;
136 + *    &lt;reset&gt; &lt;text-argument&gt;
137 + * </pre>
138 + * The definitions of the rule elements is as follows:
139 + * <UL Type=disc>
140 + *    <LI><strong>Text-Argument</strong>: A text-argument is any
sequence of
141 + *        characters, excluding special characters (that is, common
142 + *        whitespace characters [0009-000D, 0020] and rule syntax
characters
143 + *        [0021-002F, 003A-0040, 005B-0060, 007B-007E]). If those
144 + *        characters are desired, you can put them in single quotes
```

```
 145 + *         (e.g. ampersand => '&'). Note that unquoted white space
characters
 146 + *         are ignored; e.g. <code>b c</code> is treated as
<code>bc</code>.
 147 + *     <LI><strong>Modifier</strong>: There are currently two modifiers
that
 148 + *         turn on special collation rules.
 149 + *         <UL Type=square>
 150 + *             <LI>'@' : Turns on backwards sorting of accents
(secondary
 151 + *                     differences), as in French.
 152 + *             <LI>'!' : Turns on Thai/Lao vowel-consonant swapping.  If
this
 153 + *                     rule is in force when a Thai vowel of the range
 154 + *                     &#92;U0E40-&#92;U0E44 precedes a Thai consonant
of the range
 155 + *                     &#92;U0E01-&#92;U0E2E OR a Lao vowel of the
range &#92;U0EC0-&#92;U0EC4
 156 + *                     precedes a Lao consonant of the range
&#92;U0E81-&#92;U0EAE then
 157 + *                     the vowel is placed after the consonant for
collation
 158 + *                     purposes.
 159   * </ul>
 160 + *         <p>'@' : Indicates that accents are sorted backwards, as in
French.
 161 + *     <LI><strong>Relation</strong>: The relations are the following:
 162 + *         <UL Type=square>
 163 + *             <LI>'&lt;' : Greater, as a letter difference (primary)
 164 + *             <LI>';' : Greater, as an accent difference (secondary)
 165 + *             <LI>',' : Greater, as a case difference (tertiary)
 166 + *             <LI>'=' : Equal
 167 + *         </UL>
 168 + *     <LI><strong>Reset</strong>: There is a single reset
 169 + *         which is used primarily for contractions and expansions, but
which
 170 + *         can also be used to add a modification at the end of a set of
rules.
 171 + *         <p>'&' : Indicates that the next rule follows the position to
where
 172 + *             the reset text-argument would be sorted.
 173 + * </UL>
 174 + *
 175   * <p>
 176 - * <strong>Examples</strong>
 177 - * </p>
 178 - * <p>
 179 - * Creating Customized RuleBasedCollators:
 180 + * This sounds more complicated than it is in practice. For example,
the
 181 + * following are equivalent ways of expressing the same thing:
 182 + * <blockquote>
 183 + * <pre>
 184 + * a &lt; b &lt; c
 185 + * a &lt; b &amp; b &lt; c
 186 + * a &lt; c &amp; a &lt; b
 187 + * </pre>
```

```
188 + *  </blockquote>
189 + *  Notice that the order is important, as the subsequent item goes immediately
190 + *  after the text-argument. The following are not equivalent:
191   *  <blockquote>
192   *  <pre>
193 - *  String simple = "&amp; a &lt; b &lt; c &lt; d";
194 - *  RuleBasedCollator simpleCollator = new RuleBasedCollator(simple);
195 + *  a &lt; b &amp; a &lt; c
196 + *  a &lt; c &amp; a &lt; b
197 + *  </pre>
198 + *  </blockquote>
199 + *  Either the text-argument must already be present in the sequence, or some
200 + *  initial substring of the text-argument must be present. (e.g. "a &lt; b &amp; ae &lt;
201 + *  e" is valid since "a" is present in the sequence before "ae" is reset). In
202 + *  this latter case, "ae" is not entered and treated as a single character;
203 + *  instead, "e" is sorted as if it were expanded to two characters: "a"
204 + *  followed by an "e". This difference appears in natural languages: in
205 + *  traditional Spanish "ch" is treated as though it contracts to a single
206 + *  character (expressed as "c &lt; ch &lt; d"), while in traditional German
207 + *  a-umlaut is treated as though it expanded to two characters
208 + *  (expressed as "a,A &lt; b,B ... &amp;ae;&#92;u00e3&amp;AE;&#92;u00c3").
209 + *  [&#92;u00e3 and &#92;u00c3 are, of course, the escape sequences for a-umlaut.]
210 + *  <p>
211 + *  <strong>Ignorable Characters</strong>
212 + *  <p>
213 + *  For ignorable characters, the first rule must start with a relation (the
214 + *  examples we have used above are really fragments; "a &lt; b" really should be
215 + *  "&lt; a &lt; b"). If, however, the first relation is not "&lt;", then all the all
216 + *  text-arguments up to the first "&lt;" are ignorable. For example, ", - &lt; a &lt; b"
217 + *  makes "-" an ignorable character, as we saw earlier in the word
218 + *  "black-birds". In the samples for different languages, you see that most
219 + *  accents are ignorable.
220 + *
221 + *  <p><strong>Normalization and Accents</strong>
222 + *  <p>
223 + *  <code>RuleBasedCollator</code> automatically processes its rule table to
224 + *  include both pre-composed and combining-character versions of
225 + *  accented characters.  Even if the provided rule string contains only
226 + *  base characters and separate combining accent characters, the pre-composed
227 + *  accented characters matching all canonical combinations of characters from
```

```
 228 + * the rule string will be entered in the table.
 229 + * <p>
 230 + * This allows you to use a RuleBasedCollator to compare accented
strings
 231 + * even when the collator is set to NO_DECOMPOSITION.  There are two
caveats,
 232 + * however.  First, if the strings to be collated contain combining
 233 + * sequences that may not be in canonical order, you should set the
collator to
 234 + * CANONICAL_DECOMPOSITION or FULL_DECOMPOSITION to enable sorting of
 235 + * combining sequences.  Second, if the strings contain characters with
 236 + * compatibility decompositions (such as full-width and half-width
forms),
 237 + * you must use FULL_DECOMPOSITION, since the rule tables only include
 238 + * canonical mappings.
 239 + *
 240 + * <p><strong>Errors</strong>
 241 + * <p>
 242 + * The following are errors:
 243 + * <UL Type=disc>
 244 + *     <LI>A text-argument contains unquoted punctuation symbols
 245 + *        (e.g. "a &lt; b-c &lt; d").
 246 + *     <LI>A relation or reset character not followed by a text-
argument
 247 + *        (e.g. "a &lt; ,b").
 248 + *     <LI>A reset where the text-argument (or an initial substring of
the
 249 + *        text-argument) is not already in the sequence.
 250 + *        (e.g. "a &lt; b &amp; e &lt; f")
 251 + * </UL>
 252 + * If you produce one of these errors, a <code>RuleBasedCollator</code>
throws
 253 + * a <code>ParseException</code>.
 254   *
 255 - * String norwegian = "&amp; a , A &lt; b , B &lt; c , C &lt; d , D
&lt; e , E "
 256 - *                  + "&lt; f , F &lt; g , G &lt; h , H &lt; i , I
&lt; j , "
 257 - *                  + "J &lt; k , K &lt; l , L &lt; m , M &lt; n , N
&lt; "
 258 - *                  + "o , O &lt; p , P &lt; q , Q &lt r , R &lt s ,
S &lt; "
 259 - *                  + "t , T &lt; u , U &lt; v , V &lt; w , W &lt; x
, X "
 260 - *                  + "&lt; y , Y &lt; z , Z &lt; &#92;u00E5 =
a&#92;u030A "
 261 - *                  + ", &#92;u00C5 = A&#92;u030A ; aa , AA &lt;
&#92;u00E6 "
 262 - *                  + ", &#92;u00C6 &lt; &#92;u00F8 , &#92;u00D8";
 263 - * RuleBasedCollator norwegianCollator = new
RuleBasedCollator(norwegian);
 264 + * <p><strong>Examples</strong>
 265 + * <p>Simple:     "&lt; a &lt; b &lt; c &lt; d"
 266 + * <p>Norwegian:  "&lt; a,A&lt; b,B&lt; c,C&lt; d,D&lt; e,E&lt; f,F&lt;
g,G&lt; h,H&lt; i,I&lt; j,J
 267 + *               &lt; k,K&lt; l,L&lt; m,M&lt; n,N&lt; o,O&lt; p,P&lt;
q,Q&lt; r,R&lt; s,S&lt; t,T
```

```
 268 + *                    &lt; u,U&lt; v,V&lt; w,W&lt; x,X&lt; y,Y&lt; z,Z
 269 + *                    &lt; &#92;u00E5=a&#92;u030A,&#92;u00C5=A&#92;u030A
 270 + *                    ;aa,AA&lt; &#92;u00E6,&#92;u00C6&lt;
&#92;u00F8,&#92;u00D8"
 271 + *
 272 + * <p>
 273 + * Normally, to create a rule-based Collator object, you will use
 274 + * <code>Collator</code>'s factory method <code>getInstance</code>.
 275 + * However, to create a rule-based Collator object with specialized
 276 + * rules tailored to your needs, you construct the
<code>RuleBasedCollator</code>
 277 + * with the rules contained in a <code>String</code> object. For
example:
 278 + * <blockquote>
 279 + * <pre>
 280 + * String Simple = "&lt; a&lt; b&lt; c&lt; d";
 281 + * RuleBasedCollator mySimple = new RuleBasedCollator(Simple);
 282 + * </pre>
 283 + * </blockquote>
 284 + * Or:
 285 + * <blockquote>
 286 + * <pre>
 287 + * String Norwegian = "&lt; a,A&lt; b,B&lt; c,C&lt; d,D&lt; e,E&lt;
f,F&lt; g,G&lt; h,H&lt; i,I&lt; j,J" +
 288 + *                    "&lt; k,K&lt; l,L&lt; m,M&lt; n,N&lt; o,O&lt;
p,P&lt; q,Q&lt; r,R&lt; s,S&lt; t,T" +
 289 + *                    "&lt; u,U&lt; v,V&lt; w,W&lt; x,X&lt; y,Y&lt; z,Z" +
 290 + *                    "&lt; &#92;u00E5=a&#92;u030A,&#92;u00C5=A&#92;u030A"
+
 291 + *                    ";aa,AA&lt; &#92;u00E6,&#92;u00C6&lt;
&#92;u00F8,&#92;u00D8";
 292 + * RuleBasedCollator myNorwegian = new RuleBasedCollator(Norwegian);
 293   * </pre>
 294   * </blockquote>
 295   *
 296 - * Concatenating rules to combine <code>Collator</code>s:
 297 + * <p>
 298 + * Combining <code>Collator</code>s is as simple as concatenating
strings.
 299 + * Here's an example that combines two <code>Collator</code>s from two
 300 + * different locales:
 301   * <blockquote>
 302   * <pre>
 303   * // Create an en_US Collator object
 304 @@ -128,3269 +216,557 @@
 305   * </pre>
 306   * </blockquote>
 307   *
 308 - * Making changes to an existing RuleBasedCollator to create a new
 309 - * <code>Collator</code> object, by appending changes to the existing
rule:
 310 + * <p>
 311 + * Another more interesting example would be to make changes on an
existing
 312 + * table to create a new <code>Collator</code> object.  For example,
add
```

```
313 + * "&amp;C&lt; ch, cH, Ch, CH" to the <code>en_USCollator</code> object
to create
314 + * your own:
315   * <blockquote>
316   * <pre>
317   * // Create a new Collator object with additional rules
318 - * String addRules = "&amp; C &lt; ch, cH, Ch, CH";
319 + * String addRules = "&amp;C&lt; ch, cH, Ch, CH";
320   * RuleBasedCollator myCollator =
321   *     new RuleBasedCollator(en_USCollator + addRules);
322   * // myCollator contains the new rules
323   * </pre>
324   * </blockquote>
325   *
326 - * How to change the order of non-spacing accents:
327 + * <p>
328 + * The following example demonstrates how to change the order of
329 + * non-spacing accents,
330   * <blockquote>
331   * <pre>
332 - * // old rule with main accents
333 - * String oldRules = "= &#92;u0301 ; &#92;u0300 ; &#92;u0302 ;
&#92;u0308 "
334 - *              + "; &#92;u0327 ; &#92;u0303 ; &#92;u0304 ;
&#92;u0305 "
335 - *              + "; &#92;u0306 ; &#92;u0307 ; &#92;u0309 ;
&#92;u030A "
336 - *              + "; &#92;u030B ; &#92;u030C ; &#92;u030D ;
&#92;u030E "
337 - *              + "; &#92;u030F ; &#92;u0310 ; &#92;u0311 ;
&#92;u0312 "
338 - *              + "&lt; a , A ; ae, AE ; &#92;u00e6 , &#92;u00c6 "
339 - *              + "&lt; b , B &lt; c, C &lt; e, E &amp; C &lt; d ,
D";
340 + * // old rule
341 + * String oldRules = "=&#92;u0301;&#92;u0300;&#92;u0302;&#92;u0308"
// main accents
342 + *              + ";&#92;u0327;&#92;u0303;&#92;u0304;&#92;u0305"
// main accents
343 + *              + ";&#92;u0306;&#92;u0307;&#92;u0309;&#92;u030A"
// main accents
344 + *              + ";&#92;u030B;&#92;u030C;&#92;u030D;&#92;u030E"
// main accents
345 + *              + ";&#92;u030F;&#92;u0310;&#92;u0311;&#92;u0312"
// main accents
346 + *              + "&lt; a , A ; ae, AE ; &#92;u00e6 , &#92;u00c6"
347 + *              + "&lt; b , B &lt; c, C &lt; e, E & C &lt; d, D";
348   * // change the order of accent characters
349 - * String addOn = "&amp; &#92;u0300 ; &#92;u0308 ; &#92;u0302";
350 + * String addOn = "& &#92;u0300 ; &#92;u0308 ; &#92;u0302";
351   * RuleBasedCollator myCollator = new RuleBasedCollator(oldRules +
addOn);
352   * </pre>
353   * </blockquote>
354   *
355 - * Putting in a new primary ordering before the default setting,
```

```
356 - * e.g. sort English characters before or after Japanese characters in
the Japanese
357 - * <code>Collator</code>:
358 + * <p>
359 + * The last example shows how to put new primary ordering in before the
360 + * default setting. For example, in Japanese <code>Collator</code>, you
361 + * can either sort English characters before or after Japanese
characters,
362   * <blockquote>
363   * <pre>
364   * // get en_US Collator rules
365 - * RuleBasedCollator en_USCollator
366 - *                        =
(RuleBasedCollator)Collator.getInstance(Locale.US);
367 - * // add a few Japanese characters to sort before English characters
368 + * RuleBasedCollator en_USCollator =
(RuleBasedCollator)Collator.getInstance(Locale.US);
369 + * // add a few Japanese character to sort before English characters
370   * // suppose the last character before the first base letter 'a' in
371   * // the English collation rule is &#92;u2212
372 - * String jaString = "& &#92;u2212 &lt &#92;u3041, &#92;u3042 &lt
&#92;u3043, "
373 - *                     + "&#92;u3044";
374 - * RuleBasedCollator myJapaneseCollator
375 - *             = new RuleBasedCollator(en_USCollator.getRules() +
jaString);
376 + * String jaString = "& &#92;u2212 &lt; &#92;u3041, &#92;u3042 &lt;
&#92;u3043, &#92;u3044";
377 + * RuleBasedCollator myJapaneseCollator = new
378 + *     RuleBasedCollator(en_USCollator.getRules() + jaString);
379   * </pre>
380   * </blockquote>

 408 +public class RuleBasedCollator extends Collator{
 409 +      // IMPLEMENTATION NOTES:  The implementation of the collation
algorithm is
 410 +      // divided across three classes: RuleBasedCollator,
RBCollationTables, and
 411 +      // CollationElementIterator.  RuleBasedCollator contains the
collator's
 412 +      // transient state and includes the code that uses the other
classes to
 413 +      // implement comparison and sort-key building.  RuleBasedCollator
also
 414 +      // contains the logic to handle French secondary accent sorting.
 415 +      // A RuleBasedCollator has two CollationElementIterators.  State
doesn't
 416 +      // need to be preserved in these objects between calls to compare()
or
 417 +      // getCollationKey(), but the objects persist anyway to avoid
wasting extra
 418 +      // creation time.  compare() and getCollationKey() are synchronized
to ensure
 419 +      // thread safety with this scheme.  The CollationElementIterator is
responsible
 420 +      // for generating collation elements from strings and returning one
element at
 421 +      // a time (sometimes there's a one-to-many or many-to-one mapping
between
 422 +      // characters and collation elements-- this class handles that).
 423 +      // CollationElementIterator depends on RBCollationTables, which
contains the
 424 +      // collator's static state.  RBCollationTables contains the actual
data
 425 +      // tables specifying the collation order of characters for a
particular locale
 426 +      // or use.  It also contains the base logic that
CollationElementIterator
 427 +      // uses to map from characters to collation elements.  A single
RBCollationTables
 428 +      // object is shared among all RuleBasedCollators for the same
locale, and
 429 +      // thus by all the CollationElementIterators they create.
 430 +
 431 +      /**
 432 +       * RuleBasedCollator constructor.  This takes the table rules and
builds
 433 +       * a collation table out of them.  Please see RuleBasedCollator
class
 434 +       * description for more details on the collation rule syntax.
 435 +       * @see java.util.Locale
 436        * @param rules the collation rules to build the collation table
from.
```

```

```

```
1251 +    public synchronized CollationKey getCollationKey(String source)
1252 +    {
1253 +        //
1254 +        // The basic algorithm here is to find all of the collation
elements for each
1255 +        // character in the source string, convert them to a char
representation,
1256 +        // and put them into the collation key.  But it's trickier than
that.
1257 +        // Each collation element in a string has three components:
primary (A vs B),
1258 +        // secondary (A vs A-acute), and tertiary (A' vs a); and a
primary difference
1259 +        // at the end of a string takes precedence over a secondary or
tertiary
1260 +        // difference earlier in the string.
1261 +        //
1262 +        // To account for this, we put all of the primary orders at the
beginning of the
1263 +        // string, followed by the secondary and tertiary orders,
separated by nulls.
1264 +        //
1265 +        // Here's a hypothetical example, with the collation element
represented as
1266 +        // a three-digit number, one digit for primary, one for
secondary, etc.
1267 +        //
1268 +        // String:              A    a    B   \u00e9 <--(e-acute)
1269 +        // Collation Elements: 101   100   201   510
1270 +        //
1271 +        // Collation Key:      1125<null>0001<null>1010
1272 +        //
1273 +        // To make things even trickier, secondary differences (accent
marks) are compared
1274 +        // starting at the *end* of the string in languages with French
secondary ordering.
1275 +        // But when comparing the accent marks on a single base
character, they are compared
1276 +        // from the beginning.  To handle this, we reverse all of the
accents that belong
1277 +        // to each base character, then we reverse the entire string of
secondary orderings
1278 +        // at the end.  Taking the same example above, a French
collator might return
1279 +        // this instead:
1280 +        //
1281 +        // Collation Key:      1125<null>1000<null>1010

APPENDIX G: EXAMPLES OF DECLARATIONS IN JAVA SE 5.0

Package	Class Name	Declaration	Purpose of Declaration
java.security .spec	RSAMultiPri mePrivateCr tKeySpec	public RSAMultiPrimePrivateCrtKeySpec(BigInteger modulus, BigInteger publicExponent, BigInteger privateExponent, BigInteger primeP, BigInteger primeQ, BigInteger primeExponentP, BigInteger primeExponentQ, BigInteger crtCoefficient, RSAOtherPrimeInfo[] otherPrimeInfo)	Provides the specification for a particular type of RSA private authentication key, which uses multi-prime and other features for enhanced security
java.security .spec	RSAPrivateC rtKeySpec	public RSAPrivateCrtKeySpec(BigInteger modulus, BigInteger publicExponent, BigInteger privateExponent, BigInteger primeP, BigInteger primeQ, BigInteger primeExponentP, BigInteger primeExponentQ, BigInteger crtCoefficient)	Provides the specification for the RSA private authentication key
java.lang	ClassLoader	protected Package definePackage(String name, String specTitle, String specVersion, String specVendor, String implTitle, String implVersion, String implVendor, URL sealBase) throws IllegalArgumentException	Method provided in the class-loader class that loads other classes into memory, the method specifies the package corresponding to a loaded class
javax.crypto	CipherSpi	protected abstract int engineDoFinal(byte[] input, int inputOffset, int inputLen, byte[] output, int outputOffset) throws ShortBufferException, IllegalBlockSizeException, BadPaddingException;	Method provided in the Cipher service provider interface class that is responsible for encryption or decryption of data
java.net	Authenticat or	public static PasswordAuthentication requestPasswordAuthentication(String host, InetAddress addr, int port, String protocol, String prompt, String scheme, URL url, RequestorType reqType)	Method within the authenticator class that requests a password from the currently registered system authentication mechanism
java.security .cert	CertStore	public static CertStore getInstance(String type, CertStoreParameters params, String provider) throws InvalidAlgorithmParameterException, NoSuchAlgorithmException, NoSuchProviderException	Method within CertStore class that returns a CertStore object of the type and features specified in the method arguments
java.security .cert	Certificate	public abstract void verify(PublicKey key, String sigProvider) throws CertificateException, NoSuchAlgorithmException, InvalidKeyException, NoSuchProviderException, SignatureException;	Method that verifies that a particular certificate is signed using the appropriate matching private and public keys using the signature verification engine specified by the provider

javax.security.cert	Certificate	public abstract void verify(PublicKey key, String sigProvider) throws CertificateException, NoSuchAlgorithmException, InvalidKeyException, NoSuchProviderException, SignatureException;	Same as above, but uses a standard signature verification engine
java.sql	DatabaseMetaData	ResultSet getCrossReference(String primaryCatalog, String primarySchema, String primaryTable, String foreignCatalog, String foreignSchema, String foreignTable) throws SQLException;	Produces a description of all the standard SQL types supported by the targeted database
javax.crypto	Cipher	public final int doFinal(byte[] input, int inputOffset, int inputLen, byte[] output, int outputOffset) throws ShortBufferException, IllegalBlockSizeException, BadPaddingException	Finishes a multi-part encryption or decryption operation, depending on the way the cipher is initialized
java.security.cert	CertPathValidatorSpi	public abstract CertPathValidatorResult engineValidate(CertPath certPath, CertPathParameters params) throws CertPathValidatorException, InvalidAlgorithmParameterException;	Validates the specified certification path using a validation algorithm that must be specified as a method parameter
java.nio.channels	DatagramChannel	public abstract class DatagramChannel extends AbstractSelectableChannel implements ByteChannel, ScatteringByteChannel, GatheringByteChannel	This class specifies a particular type of channel for use with datagram-oriented sockets that can be bound to instances of the DatagramSocket class.
javax.crypto	ExemptionMechanismSpi	protected abstract int engineGenExemptionBlob(byte[] output, int outputOffset) throws ShortBufferException, ExemptionMechanismException;	The class defines the service provider interface for the ExemptionMechanism class. This method generates the mechanism 'key blob' that is used for encryption

APPENDIX H: DR. REINHOLD'S LIST OF DECLARATIONS IN CLASSES LISTED IN TX1062 WHICH ARE SUBJECT TO A TECHNICAL CONSTRAINT IMPOSED BY THE JAVA LANGUAGE SPECIFICATION

Class	Declaration (Partial or Full) Constrained by JLS
java.lang.AbstractMethodError	package java.lang public class AbstractMethodError …
java.lang.ArithmeticException	package java.lang public class ArithmeticException …

PROOF OF SERVICE BY KITEWORKS

I, José E. Valdés, am over the age of eighteen years old and not a party to the within-entitled action. My place of employment and business address is Orrick, Herrington & Sutcliffe LLP, 1000 Marsh Road, Menlo Park, California 94025.

On February 29, 2016, I served the following documents:

REPLY EXPERT REPORT OF PROFESSOR DOUGLAS C. SCHMIDT, Ph.D.

on the interested parties in this action by electronic service [Fed. Rule Civ. Proc. 5(b)] by electronically mailing a true and correct copy, pursuant to the parties agreement, to the following email addresses:

DALVIK-KVN@kvn.com
JCooper@fbm.com
gglas@fbm.com

I declare under penalty of perjury under the laws of the State of California and the United States that the foregoing is true and correct.

Executed on February 29, 2016, at San Francisco, California.

                                                    _/s/ José E. Valdés_____
                                                    José E. Valdés
